

## REQUIREMENTS

### SERVER

- Server running Quillix 3.2 or higher

# MuWave® Export

## DESCRIPTION

MuWave® Export is a Quillix™ Server eXtension (QSX) that exports documents to a directory or network share. The filenames for the exported documents may be generated based on any combination of the batch name, index values, or any other information. The document indexes may be exported into text or comma separated value (CSV) files. In addition, advanced operations such as database lookups are available for calculating the index values. Built-in Visual Basic scripting allows more advanced operations to be performed.

### KEY FEATURES INCLUDE;

- Provides export of Quillix batches and documents to directory or network share
- Automated document naming using index values or other information
- Supports export to multi-page TIFF or image-only PDF file formats
- Provides export of document indexes to text or CSV
- Provides document security options for securing exported documents
- Provides database lookup capability for index values or document filenames
- Integrated with MuWave Script (Visual Basic) and MuWave Reports

### FLEXIBLE AND POWERFUL

MuWave Export provides the ability to export Quillix batches and documents to a directory or network share. Images contained in the batches or documents may be converted to multi-page TIFF or even converted to image-only PDF format without the need for a separate PDF module. The batch or document indexes may be exported to either a text or comma separated value (CSV) file and the values exported may be customized using simple pull down menus, or even database lookups. The Microsoft® Windows file security may be set on each document that is exported. In addition, a database operation may be performed for each document that is exported. This is useful in situations where another system needs to be notified that a document is available for processing.

### SETUP AND CONFIGURATION

MuWave® Export is easy to install and configure on a Quillix server. Once installed the configuration is very simple and consists of providing the export location (directory or network share) and the list of indexes to be exported.

Configuration settings may be specified using simple pull-down menus. Clicking a button converts the setting into an easily customized Visual Basic script. Both the pull down menus and the advanced Visual Basic scripts provide access to all information in Quillix including all of the Quillix document and batch indexes, information about the server, dates, times, and other information. In addition full database support is provided so that it is easy to look up additional information in a database.
