

Quillix SharePoint QSX

The Quillix SharePoint QSX is designed to file documents scanned in Quillix into a SharePoint repository. The configuration options allow for the designation of a primary SharePoint site, website and library, as well as for mapping index fields to library properties.

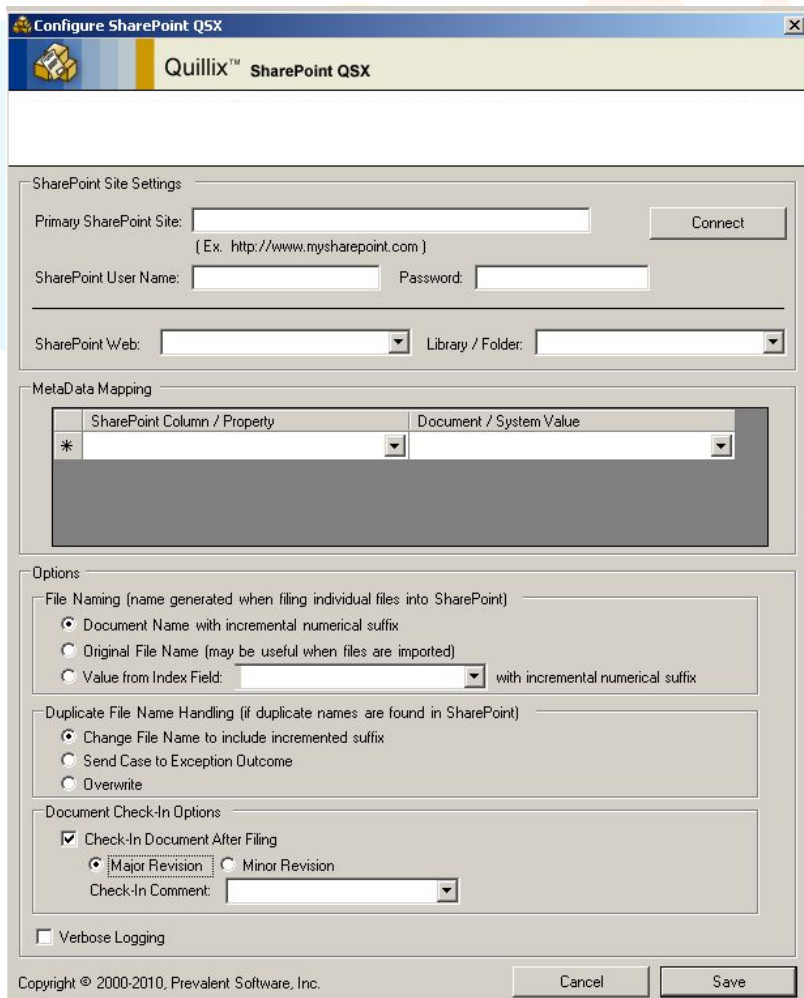

REQUIREMENTS

- Quillix 4.3 is required. Note: A custom installer can be created for Quillix 4.0 or 4.2 upon request. This will require up to a one week lead time.
- SharePoint 2010 (2007 is no longer supported)

KEY FEATURES OF THE SHAREPOINT QSX INCLUDE:

- Commits documents to a SharePoint web site via a single SharePoint credential
- Provides comprehensive mapping of Quillix index fields to SharePoint metadata
- Various options provided for document naming, either original filename, original filename with an incremented suffix, or a value from a Quillix index field.
- Document check-in options after filing, either a minor or major revision plus added comment.

CONFIGURATION SCREEN:

The screenshot shows the 'Configure SharePoint QSX' window. It is divided into several sections:
